THIS IS UNEVALUATED INFORMATION

1. A hard surface road #924 runs from Bialystok eastward to the USSR border which is located approximately 40 kilometers from Bialystok. This road is over three lanes wide, is in excellent condition and is surfaced with asphalt. It is constructed for heavy usage and many military vehicles travel this road between Bialystok and the Soviet border.
2. A number of loose surface, all weather roads #909 run in the vicinity of Ragnowka, Karakule and Suprasl. These roads are over one lane wide and are able to absorb heavy usage. The roads are gravel surfaced and in fair condition. The roads are crowned for easy drainage. However, there are no drainage ditches alongside the roads.
3. A number of loose surface, dry weather, dirt roads #935 run in the same vicinity as the loose surface roads #909. The dirt roads have a natural foundation of sand and clay and occasionally are able to absorb heavy usage. Whenever it rains, the roads become deeply rutted and potholed so that it is easier for a traveler to get off the roads and travel on the fields. The dirt roads occasionally are resurfaced and are maintained by farmers and villagers.

The Gene Ontology (GO) Consortium

Genes are annotated with terms from the Gene Ontology (GO) Consortium. The GO Consortium is a collaborative effort of several research groups, each responsible for a specific domain of biological knowledge. The GO Consortium is divided into three main sections: **Biological Process**, **Molecular Function**, and **Cellular Component**. Each section is further divided into sub-sections, each with a specific color-coded bar indicating its inclusion in the core or non-core annotations.

Criteria for inclusion in core or non-core annotations. Positive inclusion

Genes are included in the core or non-core annotations based on specific criteria. The criteria are listed on the right side of the figure, with a corresponding color-coded bar indicating its inclusion in the core or non-core annotations.
